

Batch failure investigation

Conference Document | February, 2018

Investigation is an important element of pharmaceutical quality

66

To be meaningful, the (OOS) investigation should be *thorough, timely, unbiased, well-documented, and scientifically sound*

- US FDA Guidance for Industry Investigating Out-of-Specification (OOS) Test Results for Pharmaceutical Production

66

A *structured approach* to the investigation process should be used with the objective of determining the root cause. The level of *effort, formality, and documentation of the investigation* should be commensurate with the level of risk

- ICH Pharmaceutical Quality system Q10

66

Among the essential elements of a well established Quality Management System (QMS), deviation handling plays a *key role in assuring quality in products and by contributing to continuous improvement*

- ??

- WHO guidelines for deviation handling and quality risk management

??

-99

Product quality related investigations have been one of the leading contributors to non-compliance observations and poor quality costs

1 Analysis of FDA WL over the last 3 years

2 Poor Quality costs are costs related to rejects, reworks, complaints, adverse events, recalls and other related to production failure or external issues

Indian pharmacos lag behind global benchmarks in batch failures & quality of investigations

SOURCE: McKinsey POBOS benchmarks

Indian pharmacos have face several challenges in batch failure investigation

	Fundamental gaps in product quality	Gaps in investigation process	Inability to determine root cause	Managerial & Cultural issues
3	Illustrative observations in	audits/inspections		
	"Attributed the failures to product degradation from the process, but you failed to identify the specific impurities or their root causes"	"written procedures do not adequately address the need to investigate anomalies, unexpected events, or out-of- trend results"	"ignored aberrant analytical test results rather than investigating them, determining the root cause, & implementing appropriate corrective actions"	"The management review process was deficient, the meetings stated that results were satisfactory; despite there being an obvious adverse trend increase"
	<i>"Multiple batches of product failed to meet finished product specifications, including active ingredient content"</i>	<i>"Investigations did not include hypothesis for test failure before retesting"</i>	"Firm invalidated many out- of-specification (OOS) assay results without sufficient investigation to determine the root cause of the initial failure"	" gloves are worn during these critical interventions, using non-integral gloves for aseptic processing is an unacceptable practice. It is a direct risk to product sterility"

5 major areas to improve batch failure investigations

Improve fundamental product quality by taking an end-to-

1

end lifecycle approach

2

Establish a harmonized best practice process, roles & responsibilities, and investigation tool-kit

3

Improving fundamental understanding of unit operations and root-cause assessment capabilities in the organization

4

Use the right combination of leading & lagging indicators coupled with a strong governance mechanism

Build a culture of Right-First-Time and getting to the rootcause

NOT FXHAUS

1 Lifecycle approach is critical to product quality

alification verification
it is Ongoing assurance gained during routine production that the process remains in a state of control

Covered in detail in the Process Validation guidelines to be released on Day 2

2 Best practices in batch failure investigations need to be implemented

Ke	ey areas	Description	
1	Best practice guideline	 Developed overall guidance on batch failure investigation for laboratory and manufacturing 	 6.0 Investigation of batch failure at various stages (kemi-finished/bulk product) during product manufacturing 6.1 If any incidence of non-conformance or deviation from approved process (Batch Manufacturing Record) or specification occurs during the manufacturing or during in-process or finish product analysis, it shall be logged as port the respective SOP. These incidence of non-conformance may or may not result in batch failure. 6.2 Any individual who observes / identifies (investigation initiator) an incident in which a non-conformance, discrepancy, failure of Good Manufacturing practice has occurred, must record the incident on an appropriate document (i.e., investigation form / worksheet) and notify to a bit immediate supervisor. In case the individual does not have access to document the nonconformance, he will notify it to a his immediate supervisor or a Quality Assurance individual for documentation and further action. The information should be documented in the investigation form / worksheet. 6.3 The initiator or department supervisors will take immediate action (i.e. containment action) to stop the variant condition from continuing and notifies QA of the non-conformity, devide immediate curse of action and protential product impact based on available information.
2	Investigation checklist	 Standardized the investigation criteria for common test failures through 13 checklists 	<section-header><section-header><section-header><section-header></section-header></section-header></section-header></section-header>
3	Governance mechanism	 Defined RACI matrices for defining governance and escalation mechanism 	Step Reportability Consumer Interstigation RACI Matrix - Manufacturing Step Reportability Amountality Consumer Interstigation RACI Matrix - Manufacturing Issue Homitication / Doer / Observer RMM - QA Interstigation QA / Concerned QA SME/ SQA / SH Interstigation QA / Concerned QA SME/ SQA / SH Root Cause GA / Concerned QA SME / COA/ COH Reasonability Carr Assessment / Impact CTT QA SME / COH / SQA / SH Reof Assessment / Impact CT QA CAPA Inglementation Concerned QA SME / COH / SQA / SH Reof Assessment / Impact CT QA CAPA Inglementation Concerned QA SME / COH / SQA / SH CAPA Inglementation Concerned QA SME / COH / SQA / SH CAPA Effectiveness QA QA Concerned COH / SQA / SH Function SH CAPA Inglementation GA SME / COH / SQA / SH

③ Need to build fundamental understanding of unit operations & root cause assessment capability in middle managers

Gaps in fundamental understanding & investigative capabilities in unit operations

Unable to get to the root cause of deviations...they know what they need to do but in case of deviation do not know "why" - **Head of Ops**

Do not understand the critical process parameters and their impact on quality

- Head of Quality

Unable to get to the root cause...do not have the analytical & investigative mindset

- Site Head

Do not get the right guidance from supervisor when we face issues. Who do we ask?

~ Shopfloor operator

Skills to be developed

- Understanding of Critical Process Parameters (CPPs) for the unit operations and their linkage to Critical Quality Attributes (CQA)
- Ability to resolve complex issues that lead to non-conformances and non-compliances
- Conducting Root cause assessment through application of Problem solving tools, and methodologies

4 Leading indicators help us connect operations fundamentals and their influence on Quality & Compliance outcomes

SOURCE: McKinsey POBOS benchmarks

5 Culture matters: Quality culture drives ~30% of lot acceptance rate

Use of Advanced Analytics: By connecting & analyzing existing data, we can identify risk factors for deviations / OOS

Example: Granulation Temperature correlated with deviations

Statistical analysis

🥺 Probability of deviations 🛛 🔊 Number of batches 🔍 Risk ratio

NUMBERS ANONYMISED

13

Example: Natural Language Processing (NLP) enables reconstruction of free text from available data to help in investigations

Batch failure investigation

Innovation, Quality and Global Reach

 6+ individuals directly involved in writing the guidelines

Extensive expert involvement for review and refinement

A comprehensive guideline is designed covering the entire investigation process

Guidance for batch failure investigation

- Includes all potential batch failure causes at "any stage of manufacturing" (deviations) & "quality control" (OOS) and post distribution including stability failures and those coming from market complaints etc.
- Provides guidance for best practices for both laboratory and manufacturing investigation

atch Failure Inve	stigation	
Lab Error		Manufacturing Process Issue
	Phase I	
	Obvious lab e	error
Phase II		
Hypothesis ba	ased Lab Investigation	Manufacturing Investigation

	Laboratory Investigation									
Investigation outcome	Company-1	Company-2	Company-3	Company-4	Company-5	Company-6	Proposal			
Root Cause Identified (Obvious Laboratory Error definitevely attributable)	Retesting in Triplicate	Retesting in 5 replicates for most of the tests	Retesting in duplicate	Single analysis	Retesting in duplicate	Retest in single as per standard analytical test procedure	Re-tesing in single.			
Probable/Assign able Cause Identified	Probable/Assign able Cause Identified Phase-I: Re- testing in triplicate by first analyst. Phase-II: Re-		No such direct provision	Re-testing in triplicate by two analysts.	Retesting in duplicate	Retesting in 3 replicates each by two analyst.	Re-testing in triplicate by 2 anlaysts only if it's based on sound scientific rationale and proved through hypothesis studies. For commercial batches, err on the side of caution.			
No root cause identified	Reject batch	Reject batch	Retesting in six replicates and decision to be taken by QA if all results pass	Re-testing in triplicate by two analysts. QA will take final decision.	For tests with numeric results - 3 replicated For qualitative Tests 7 replicates	Reject batch	Reject the batch.			

Guidance document consists of 3 areas to standardize the approach batch failure investigation across the industry

2

Overall guidance on batch failure investigation for laboratory and manufacturing

Generalized procedure for end-to-end handling of batch failure by standardizing approach for responding to common issues as well as situations outside SOPs Dosage form wise checklists defining investigation criteria for common test failures

13 checklists to standardize the investigation criteria for dosage form specific common test failures, for e.g tablets, liquid sterile products Governance and escalation mechanism

3

RACI matrices for defining governance and escalation mechanism both in lab and manufacturing

Key highlights from guidance document for laboratory investigation

- FDA is very critical of any re-testing for batch release decisions without root cause identification. Thus, it's proposed that the batch where root cause of failure is not identified will be rejected
- Wherever probable / assignable cause is identified through experimental/hypothesis testing, re-testing is allowed. We have added a specific criteria that apart from retest results meeting acceptance criteria, there should also be closeness among the results observed. Specific guidance of RSD of the replicate results for various tests is provided
- The decision making process for batch disposition is described separately for the commercial batches and exhibit batches. This is based on the risk and amount of information available for these two types of scenarios

Important: Err on the side of caution in case of commercial batch disposition decision whenever probable or assignable cause is identified

Key highlights from guidance document for manufacturing investigation

- The Critical Process Parameters (CPP) & Critical Quality parameters (CQA) must be defined during product development for faster & accurate investigation.
- The checklist driven approach will help in preserving the line of action to be taken during investigation
- The process of investigation to become structured by ensuring investigation is conducted by a separate group who will be a set of SMEs brought together depending on the type of investigation
- In-depth review of batch data report / alarm report / event report (audit trail) should be done in order to help evaluate any failure in phase II investigation
- Brain storming and personal interview must be completed and documented at an earliest i.e. in level I investigation
- On site visit by the investigation team preferably on the same day will be helpful to collect first-hand information of failure

1 Batch Failure Investigation - Laboratory

Commercial batch

- Root cause identified Remove the cause and re-analyze. Initiate CAPA to eliminate root cause in further testing.
- Probable cause identified Verify if probable cause is clearly proven and attributable to OOS. If yes, re-analyze.
 Always err on the side of caution. Initiate CAPA to eliminate probable cause in further testing.
- No root/probable cause identified OOS stands valid. Assess if this is one off case. If repetitive, method shall be looked into.

Stability batch

- Root cause/probable cause identified If not concluded within 3 days, inform concerned regulatory agency (FAR).
 Investigate whether cause is applicable to other batches. Further action is based on this assessment. May add additional time points to stability program for further monitoring. Initiate CAPA to eliminate cause.
- No root/probable cause identified All above actions. Consider additional testing of retention samples. Take market action as warranted based on all available data. Initiate CAPA based on outcome of overall investigation.

1 Batch Failure Investigation - Manufacturing

- Root cause identified Reject the batch. Initiate CAPA and proceed with further manufacturing.
- Probable cause identified Reject the batch. Initiate CAPA and closely monitor further batches to ensure CAPA effectiveness.
- No root/probable cause identified Reject the batch. Assess if this is one off case. Manufacture further batches under close monitoring and extensive analysis.

Stability batch

- Root cause/probable cause identified Inform concerned regulatory agency (FAR). Investigate all batches within expiry at site and on the market whether the same cause is applicable. Consider additional testing of retention samples. Take market action as warranted based on all available data. Initiate CAPA based on outcome of overall investigation.
- No root/probable cause identified All above actions. Stop further manufacturing. Refer product to R&D.

2 The consolidated final guidance lays out investigation approach both for manufacturing and lab along with 13 detailed checklists

List of checklists included in the guidance

- Checklist for common test failures across all dosage forms:
 - Assay
 - Relates Substance
- Checklist for common test failures for tablets:
 - CU Tablets/capsules
 - Weight variation
 - Disintegration
 - Dissolution
 - Hardness
 - Thickness
 - Friability
- Checklist for common test failures for liquid sterile products (Eye/Ear Drops/ Injectable):
 - Content uniformity
 - Foreign particles
 - Glass particles
- Separate checklist for lab investigation

Check list is applicable for following doage forms: Tablets (R/ER/DR/MR/SR)/Capsules (Hard Gelatine/ Soft Gelatine)/ Lyophilized/Transdermal patches /Oral Liquids (solution /Syrups/ S inhalation (DPI/(zy / Ear Orops	Suppositori Jspensions	es /Binh:

Stop	Start	Improve
 When to stop? Root cause of failure can not be identified Consecutive batches fail % of batches failed cross the threshold limit 	 How to start again? Reach out to R&D to understand potential reasons for batch failure Plan experiments with R&D help and take trials to understand the causes Manufacture and monitor the batch if process parameters are not changed Go through process validation if there's a change in process parameters 	 How to improve? Continuous evaluation of batches. Continued Process Verification Trending CQAs Close monitoring of CPP (Critical process parameters) and Cpk of CQAs (Critical Quality Attributes) to take preventive actions against batch failures

The group has also drafted a set of open questions for inputs from the regulators

- At what point during the investigation one should consider immediately stopping production?
- What action should be taken in case no root cause is identified eg. Batch rejection?
- What is guidance to understand the impact of investigation results of experimental batches on previous batches and validations?
- What is the impact of batch failure with no root cause on validation status of product?
